Claim 9; Page 31-32; 70pp; English.

The present invention describes a DNA molecule derived from a prokaryotic cell, where at least one of the DNA regions encoding NXB (where N = asparagine, X = any amino acid other than proline, and B = serine or threonine) has been modified so that no N-glycosylation occurs during the expression in a eukaryotic cell. Also described: (1) a fused DNA molecule, where a DNA encoding a signal sequence has been ligated to the N-terminal end of the modified DNA molecule as described above so that it may be expressed as a fusion protein; (2) a recombinant virus integrated with the DNA molecule or the fused DNA molecule described above; (3)

producing a modified or fusion protein by using the recombinant virus described above, to express a protein encoded by the modified DNA molecule or the fused DNA molecule in a eukaryotic cell; and (4) a vaccine comprising the recombinant virus. The DNA molecule has virucide and immunostimulant activities. The DNA molecule is useful for producing a vaccine for treating viral infections. The present sequence is used in the exemplification of the present invention

                                                                           This sequence represents DNA encoding an antigenic protein of Mycoplasma gallisepticum having an epitope specifically recognised by the monoclonal antibody (MAD) 35A6. This antigenic protein inhibits the metabolism of bird infecting mycoplasma. The antigenic protein and the DNA molecule can be used in the preparation of component and viral vaccines against mycoplasma infection in birds. Mycoplasma infection can be diagnosed by hybridising DNA in a sample with a DNA probe corresponding to 10 or more (preferably 15 to 40) bases of the antigenic protein gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a novel avian vaccination against virulent strains of Mycoplasma gallisepticum. The vaccination compriises administering to a bird an immunogen comprising a cytablesence-deficient M. Gallisepticum having an inability to express at least two of three of the following proteins expressed by wild-type M. gallisepticum, cytadhesin molecule Gaph, crmh protein, 45 kDa protein. The composition of the invention may have virucide activity and may be used as a virucide. The vaccine is useful for preventing M. gallisepticum virus infection in birds. The present sequence represents the DNA sequence encoding the Mycoplasma gallisepticum vaccine of the invention. This sequence contains the coding sequences of the Gap-A, crmh and 45kDa proteins which are not expressed in cytadherence deficient M.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   New method of avian vaccination against virulent strains of Mycoplasma gallisepticum by administering to a bird an immunogen comprising a cytadherence-deficient M. gallisepticum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              3898 ITAGITAAATCAAGCAAGAAGGCTAGATGCTAATTCTGTTAGACTTGCAGGTCTTGGACAA

This invention describes a novel gene transfer vector (NI) which comprises (1) a first nucleic acid sequence (1) encoding one or more light trigger apoptosis; (2) a second nucleic acid sequence (II) encoding one or more antigens; and optionally (3) a third nucleic acid sequence (II) encoding one or more antigens; and optionally (3) a third nucleic acid sequence (IV) encoding one or more auticide enzymes. The products of the invention may be unciding one or more suicide enzymes. The products of the invention have antialialmentory, immunomodulatory, rheumatic, arthritic and dermatological activity and can be used in gene therapy. The gene vector may be used to produce medicine for the prevention or therapy of autoimmune diseases, such as rheumatoid arthritis, systemic lupus erythematosus, Sjoegren-Syndrome, polymyositis, dermatomovitis, polymyagica, rheumatism, arterificis temporalis, Crohn's disease, Bedherew disease, colitis ulceros, autoimmune hepatitis, diabetes mellitus (type I), suprarena body untiple sclerosis, myasthenia gravis, of for the prevention or therapy of diseases associated with chronic inflammations, per immunopathogens, particulary inflammations associated with viral or bacterial infection, particulary hepatitis B or C infections or of the inflammation of the brain after infection form Masern virus, or transplant rejections. The vector may be used in ex vivo modification of animal or mammal cells, particularly human cells. This sequence arise are produced and the prevent of animal or mammal cells, particularly human cells. This sequence
                                                                                                                                                                                                                             New gene transfer vector useful in the prevention and treatment of autoimmune and chronic inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 10651 BP; 2782 A; 2618 C; 2490 G; 2759 T; 0 U; 2 Other;

The present invention describes a DNA molecule derived from a prokaryotic cell, where at least one of the DNA regions encoding NXB (where N = saparagine, X = any amino acid other than profile, and B = serine or threonine) has been modified so that no N-glycosylation occurs during the expression in a eukaryotic cell. Also described: (1) a fused DNA creaminal end of the modified DNA molecule sequence has been ligated to the N-terminal end of the modified DNA molecule described above so that it may be expressed as fusion protein; (2) a recombinant virus integrated with the DNA molecule or the fused DNA molecule described above; (3) producing a modified of fusion protein by using the recombinant virus described above, to express a protein encoded by the modified DNA molecule or the fused DNA molecule in a eukaryotic cell; and (4) a vaccine comprising the recombinant virus. The DNA molecule for producing a vaccine for treating viral infections. The present sequence is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid

encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated antisepatide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation, or the activity of a gene in an operon required for proliferation; (7) identifying a gene in an operon required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for reduluar proliferation or the biological pathway in which a proliferation or the proliferation or the proliferation or agene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) prolifing a compound; a activity; (11) a culture comprising strains in which the gene or organism acts; (9) manufacturing an antibiotic; (10) prolifing the extent to which each of the strains is present in a culture or collection of arrains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for cellular proliferation to isolate endidate molecules for rational dentifying proteins or screening for molecules for rational correction or an organism. The antisense nucleic acids required for cellular proliferation in cells other than S. aureus, S. typimmrium, R. pneumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from Windows.

```
The sequence encodes a cytadhesin protein from Mycoplasma gallisepticum. All or part of the sequence may be used as a probe for diagnosis of M. gallisepticum infection in poultry, e.g. turkey or fowl. The sequence has several UGA codons, which may be eliminated to avoid problems of several tiro due to irregular codon usage. The sequence may be cloned in a vector for recombinant cytoadhesin production, for use as an antigen in immunoassay formats
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               acid encoding cytadhesin protein - used as a probe to diagnose Mycoplasma gallisepticum infection in poultry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The M.pirum adhesin gene was isolated using a probe based on the 3'- end of the known M.genitalium adhesin gene. M.pirum is found in AIDS patients and the adhesin may have a role in infection of cells by HIV. If so, the M.pirum adhesin protein will be useful in vaccines to protect against the cytopathic effect of the Mycoplasma and against that of HIV. (Updated on

The present invention describes a purified Anopheles gambiae olfaction polypeptide comprising a 383, 394, 380, 411, 412, 391, 157 or 401 residue modified amino acid sequence (see ABP52843) to ABP52840) ($31), a conservatively modified amino acid sequence of them, or a sequence of ($31) with at least comprising: (a) a nucleotide sequence encoding the purified Anopheles gambiae olfaction polypeptide; or (b) a nucleotide sequence that hybridises under stringent conditions to a hybridisation probe comprising a 1964, 1239, 1142, 1236, 1194, 1176, 474 or 1206 nucleotide sequence hybridises under stringent conditions to a hybridisation probe comprising a 1964, 1239, 1142, 1236, 1194, 1176, 474 or 1206 nucleotide sequence complement; and (2) a method for identifying an agent that binds to mosquito olfaction molecules (b) contacting a 1964 and the comprising; (a) providing an isolated mosquito olfaction molecule, and (c) detecting specific binding of the test agent to the isolated mosquito olfaction molecule, and (c) detecting specific binding of identifies the test agent with the specific binding identifies the test agent as a mosquito olfaction-binding compound. The mosquito olfaction molecules are useful for mosquito management, i.e. controlling this pest and disease vector. A

                                                                                              The present sequence is that of genomic DNA encoding a novel mosquito receptor 2. A cDNA sequence for odorant receptor 2. A cDNA sequence for odorant receptor 2 is given in ACF79719. The invention provides 9 novel mosquito polypeptides and the nucleic acids encoding them. These are odorant receptor molecules 1-7 and arrestins 1 and 2. The odorant receptors function in a ligand-induced signal transduction pathway for the activated signal transduction. Arrestin functions to inhibit the activated signal transduction. Arrestin functions to inhibit the activated signal transduction cascade. Thus, the odorant receptors act as an 'on' switch, and arrestin as an 'off' switch for the odorant detection system of the mosquito Methods are provided for identifying compounds that interfere with the operation of the mosquito olfactory system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ATAMAMAMAMACAMTAMTAMACAMTAMTAMGAMTAMCAMCAMCAMCAMTAMTAMGAM 3011

The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid relukaemia, Alzheimer's disease, AlDs, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  376 CAAACAAGAGCATATTATGCTCTGTTGGTTAATGATGAAGCTAACGTTCATTTAAAAAGA 435

(KSHV) latency associated nuclear antigen (LANA) gene. KSHV is also known as thuman Herpes Virus a Haman Herpes Virus a Grand and beings to the rhadino virus, or gamma latency as thuman Herpes Virus a Grand and beings to the rhadino virus, or gamma persistence of rhadino virus DNA protein is necessary for the efficient persistence of rhadino virus DNA in mammalian cells. Persistent rhadino virus infection is implicated in a variety of diseases e.g. Kaposi's scrome (KS), Primary Effusion Lymphoma (PEL) and multicentric radio of the few gates expressed from the latent virus in a latent form. One of the few genes expressed from the latent virus land. LANA. LANA associates with both human chromosomes and with the rhadino virus cis-acting element (RVCAR), thereby providing a tethering function: the KSHV DNA episome is "tied" to the host chromosomes. This allows the viral DNA to persist in the host call. The present sequence may be used to screen and identify molecules that inhibit LANA interaction with RVCAR, thereby interfering with the latency cycle of this virus. Potential antiviral treatments for the above mentioned diseases may therefore be based on LANA deregulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               3057

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ઠે
                                                                                                                                                                                                         The invention provides a composition comprising nucleic acid, histone HI protein and expression vector operationally encoding a protein suitable for tethering the nucleic acid to the histone HI protein, where the tethering protein is LANA. The composition is useful in aiding the rethering protein is LANA. The composition is useful in aiding the rethering protein suitable for tethering DNA to Histone HI. Methods for screening protein suitable for tethering DNA to Histone HI. Methods for screening or protein suitable for tethering DNA binding sites are useful for viral proteins to histone HI and DNA binding sites are useful for the presents the method of viral transfer. The composition has applications to gene therapy, including the treatment of multiple sclerosis, parkinson's disease, Huntington disease and diabetes. The present sequence represents the nucleotide sequence of the Kaposi's sarcome associated herpesvirus (human herpesvirus 8) latency-associated nuclear antigen (LANA), which acts as a tethering protein.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a system (A) for maintaining a plasmid as an episome in mammalian cells, comprising the rhadinoviral sequence LANA (latency-associated nuclear antigen) of 3489 base pairs (see ABA3487, S1) expressed in the cell, and the rhadinoviral sequence RVCAB (rhadinoviral cis-acting element) of 801 base pairs (see ABA3488, S2) present in the plasmid. Also describes is a method for maintaining a closed circular DNA in cell by expressing (S1) in the cells and having (S2) as a cis-acting and maintenance sequence in the DNA. (A) is particularly used in gene therapy (or other gene transfer applications) that uses mammalian cells in which LANA is expressed. (A) improves persistence of gene therapy vectors in cells. The present sequence encodes Kaposi's sarcoma-associated herpervirus (KSHV, also called human herpesvirus 8) LANA protein, which is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               useful in

Submitted (102-JUN-1999) Genoscope - Centre National de Sequencage : Submitted (102-JUN-1999) Genoscope - Centre National de Sequencage : BP 191 91006 EVRY cedex - FRANCE (E-mail : seqref@genoscope.cns.fr - Web : www.genoscope.cns.fr)

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutovy Oscogawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPOI-98 and was constructed by partial BCORI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2; nbw sp, the same strain used for the BDGP's Pl and RST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             LIUI DP DNA linear GSS 03-JUN-1999

Determination of this BAC-end sequence was carried out as part of collaboration with the Barkeley brosophila Genome Project (BDGP).
The BDGP is constructing a physical map of the Drosophila melanogaster agenome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Gsoegawa and Aaron Mammoser in Peter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial ECORI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2: or bw sp, the same strain used for the BDGP's Pl and box to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

Determination of this BAC-end sequence was carried out as part of collaboration with the Barkeley Directophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitily.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-99 and was constructed by partial EcorI disestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's PI and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Waw genoscope cns its last the Backend sequence was carried out as part of a collaboration with the Buckend sequence was carried out as part of a collaboration with the Buropean Drosophila Genome Project (BDGP) - http://www.edgp.ebi.ac.uk ... This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CBPH (Centre d'Ethude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        3103 AAACCAACTGGGCCTAAATCTGGTGCGCCTACAAAACCAACTGCTCCTAAGCCAGCTGCT 3162
